

### Intermediate Pivot sets

(2 Pivot Portions)

These two portions are used for conditions where doors are very high and/or are very heavy. They are mounted and mortised through the middle of the hinge side of the door to prevent warpage, and to supply additional support. The "T" portion is mortised to the jamb and the "D" portion mortised into the door. A notch must be cut into the door at this point for the total thickness of the offset of both portions including washers, to protrude.

T4i and D3i, T5i and D4i or  
T5i x D3i may be used, depending on jamb  
condition space available, side or back jamb.

T4i x D3i is a back jamb intermediate, set.  
T5i x D3i is a side jamb intermediate, set.
